

Wesmar's HD800/160-6 and Liao Da Zhong - A winning combination

When Mr Wang, Fleet Manager of Dalian Kairun Fishing Company Ltd., installed a WESMAR HD800/160-6 in May 1999, his vessel was one of the first in China to be equipped with sonar technology. His company operates 2 groups of 36 meter trawlers in pair trawling operations in the Yellow Sea where the depths of waters are between 30-60 meters. Anchovies, Croaker and Silver Pomfret are some of the products that he catches depending on the season. When asked how his company became one of the top private fishing companies in Dalian, his reply was:

"In Dalian's fishing Port, there are over 1,000 pair trawlers operating in the same area. In the past it was the boats with echo sounders that had the edge over those that didn't. In the past few years, it has become more and more difficult to catch fish in the Yellow Sea. I realized that in order to stay ahead of the others, I needed to be able to see underwater. I am glad to be using the WESMAR HD800/160-6 as it gives me the ability to detect the fish.

The unique split screen feature enables me to steer my vessel toward the larger school of fish and what depth to set

my net. This is a very important factor in trawling operations. The definition of the HD800 is excellent. This is something I was not able to control before having WESMAR's sonar on board. I am currently building another pair of trawlers. Of course they will have WESMAR sonar onboard."
