

Precise Thruster Control

by **WESMAR**

WESMAR's Pro-Thrust G-Series controller puts every command at your fingertips. It's easy-to-use, and gives you the ability to accurately maneuver your vessel like never before.

Multi-Thrust Z-Axis Hat Switch

Precisely control the action of your bow and stern thrusters in tandem by simply turning clockwise or counter-clockwise. Applies variable power based on turn range to allow vessel positioning that is virtually impossible with a standard joystick control.

Multi-Directional Motion Control

The Pro-Thrust controller gives you complete command of both bow and stern thrust based on the 'any direction' movement of joystick relative to center axis. The maneuverability is extraordinary.

Optional Display

This LCD panel provides a visual indicator of thruster status and simplifies set-up, diagnostics, and troubleshooting.

Take-Control Switcher

For boats with multiple control stations. Indicator light signifies station in command. Button switch transfers control from one station to another.

Holding-True Actions

Set a thrust action and push right or left button to retain. Action runs until toggle is moved again. Perfect for holding steady during passenger disembarking. Valuable time-saver for commercial users.

The Pro-Thrust controller is available for all WESMAR thrusters except DC On-Off models. Ask your sales person to make it a part of your thruster package. If you already maneuver with WESMAR, this industry-compatible control upgrade will make a significant difference in performance and ease of use.
